How to install
REPLACEMENT TREADS
*where the stairway is already
constructed!*

Replacement treads are easy to install in a home where the stairway is already constructed. The body of replacement treads is 1/2" thick and the nose is 1" thick. The body is only 1/2" thick because this is the thickness of carpet. When the carpet is removed the body of the replacement tread is installed and the proper step height is maintained. In order for a stairway to be safe the rise for each step needs to be the same. If regular treads are used as a replacement for carpet, then the first step would be 1/2" too tall and the last step would be 1/2" too short.

Begin by removing the carpet from your stairs, this will reveal the substructure

The nosing needs to be marked so that it can be cut and removed.

Cut the nosing using a circular saw and finish the cut with a flush cutting saw.

5.

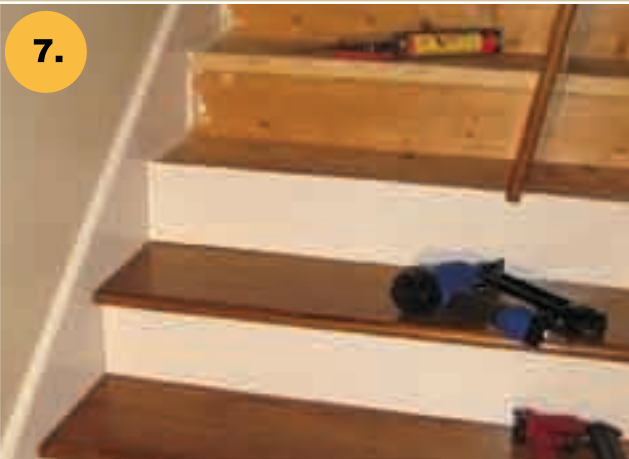

Mark the treads and cut them to length. Each tread should be measured and cut individually since stairway widths will vary from one step to the next step.

6.

Install risers with construction adhesive and finish nails. Replacement risers are only 1/4" thick, therefore use 3/4" nails.

7.

Install treads with construction adhesive. It is important to apply construction adhesive on the top and front of the nose of the undercarriage of the stairs. Use 1 1/2" finish nails or finish screws to attach replacement treads.

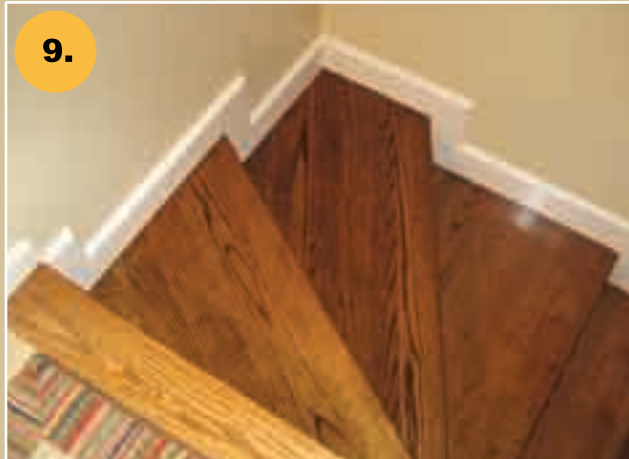

8.

Make a template of the winder tread location. Lay the template on the winder tread and trim to fit using a circular saw.

9.

Install winder treads

10.

Enjoy your beautiful new stairway.

Specialists are waiting to serve you:

For assistance building your online order call us and ask for "customer service".
For assistance calculating or laying out your staircase ask for a "stair specialist."
