

Intermediate Posts

It's no secret that we suggest placing a post every 4' of your run. But what if you don't want a structural wood post every 4'? What if pillars or other structures make that 4' spacing awkward or impossible?

Your Posts, Your Way

Intermediate Posts are the saviors of those "what if" scenarios. Standing in long gaps to prevent cable deflection, these Intermediate Posts allow you to place structural wood posts up to 8' apart. They're even available in three designs and multiple finishes. Take a look at our Intermediate Post offerings and see which one can save your run.

3/16" Intermediate Post

A light look at an attractive price, the 3/16" Intermediate Post is a customer favorite for level or angle applications. Attachment screws, a mounting bracket, and a foot cover are included with the post.

Intermediate posts are designed to prevent cable deflection only and do not provide structural support to cable railing systems. Keep structural posts (at least 3 1/4" square) no more than 8' apart to maintain the structural integrity of your cable railing system.
